

PROGRAM 3

- a) Write a program to check prime number
- b) Write a program for Arithmetic calculator using switch case menu

a) Write a program to check prime number

```
import java.util.Scanner;
public class Prime {
    public static void main(String[] args)
    {
        int num ;
        boolean flag = false;
        Scanner s1=new Scanner(System.in);
        System.out.println("Enter the Number");
        num=s1.nextInt();
        for (int i = 2; i <= num / 2; i++)
        {
            // condition for nonprime number
            if (num % i == 0) {
                flag = true;
                break;
            }
        }
        if (flag)
            System.out.println(num + " is not a prime number.");
        else
            System.out.println(num + " is a prime number.");
    }
}
```

b)Write a program for Arithmetic calculator using switch case menu

```
import java.util.Scanner;
class Main {
    public static void main(String[] args) {
        char operator;
        Double number1, number2, result;
        // create an object of Scanner class
        Scanner s1 = new Scanner(System.in);
        // ask users to enter operator
        System.out.println("Choose an operator: +, -, *, or /");
        operator = s1.next().charAt(0);
        // ask users to enter numbers
        System.out.println("Enter first number");
        number1 = s1.nextDouble();
        System.out.println("Enter second number");
        number2 = s1.nextDouble();
        switch (operator) {
            // performs addition between numbers
            case '+':
                result = number1 + number2;
                System.out.println(number1 + " + " + number2 + " = " + result);
                break;
            // performs subtraction between numbers
            case '-':
                result = number1 - number2;
                System.out.println(number1 + " - " + number2 + " = " + result);
                break;
            // performs multiplication between numbers
            case '*':
                result = number1 * number2;
                System.out.println(number1 + " * " + number2 + " = " + result);
                break;
            // performs division between numbers
            case '/':
                result = number1 / number2;
                System.out.println(number1 + " / " + number2 + " = " + result);
                break;
            default:
                System.out.println("Invalid operator!");
                break;
        }
    }
}
```
